Art Unit: 1714

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1- 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pudleiner et al, US Patent No. 6,022,939.

3. Pudleiner et al discloses thermoplastic polyurethanes formulated from diisocyanates, polyhydroxy compounds and chain extenders. Suitable chain extenders for the invention include mixtures of hydroxyalkyl benzenes and alkanediols. The hydroxyalkyl benzenes of the Pudleiner et al invention correspond to the chain extenders of applicant's invention while the alkanediols of Pudleiner et al correspond to the crystallization retarding component of applicant's invention. Therefore, the components of applicant's invention are clearly disclosed by patentee. Patentee further discloses that catalysts may be used to formulate the polyurethanes which may be prepared by any method and apparatus conventional in the art. Extrusion is set forth as a possible method of producing the polyurethanes components. The ratios of components of the patented invention overlap those of the present claims, therefore it would appear obvious that although patentee is silent to certain properties required of applicant's claimed invention, those properties are inherent to the patented invention. Since the components of Pudleiner et al are used at proportions overlapping those of applicant's claims, it would have been obvious to one of ordinary skill in the art at the time of applicant's invention to vary those proportions in any manner to achieve the desired polyurethanes. Further properties of the

Art Unit: 1714

resulting urethane, such as hard segment content and crystallization exotherm would have been derived inherently by formulating the claimed polyurethanes in a conventional manner.
